

5 / C: The Taxi Problem

Contents

Contents	1
1 Instructions	1
2 Preparations	2
3 Variant A: Group	4
4 Variant B: Solo	5
5 Energy Density and Specific Energy	9

1 Instructions

Do the preparations first. Then,

Group If you are on-campus, or can otherwise form a group of 3–4, do Variant A.

Solo If you are on your own, read the context in Variant A, then do the guiding questions as outlined in Variant B.

When you are finished, do the Specific Energy/ Energy Density section.

2 Preparations

1. Stoichiometric calculations

How would you do each of the following?

- (a) Calculate the molar mass of a compound (e.g., $C_2H_6(g)$)

SUM UP ATOMIC MASSES OF ATOMS IN MOLECULE.

e.g., $A_C + A_C + 6(A_H)$

$= (12.0 + 12.0 + 6.0) \frac{g}{mol} = 30.0 \frac{g}{mol}$

- (b) Calculate the number of moles in a compound, given the mass (e.g., 60 g of $C_2H_6(g)$)

<p>① FIND MOLAR MASS M</p> <p>② FIND n BY $n = \frac{m}{M}$</p>	<p>EXAMPLE</p> <p>$M = 30.0 \frac{g}{mol}$</p> <p>$n = \frac{m}{M} = 60 g \div 30 \frac{g}{mol}$</p> <p>$= 60 g \times \frac{1}{30} \frac{mol}{g}$</p> <p>$= 2.0 mol$</p>
--	---

- (c) Calculate the mass of a certain volume of liquid (e.g., 250 cm^3 of ethanol)

MULTIPLY BY ITS DENSITY ρ

e.g., $m_{EtOH} = V \times \rho_{EtOH}$

$= 250 \text{ cm}^3 \times 0.789 \frac{g}{\text{cm}^3} = 197 g$

WRITING OUT UNITS IN INTERMEDIATE STEPS, AND MAKING SURE THEY CANCEL OUT TO SENSIBLE OUTCOMES.

THIS IS AN **ESSENTIAL** TECHNIQUE FOR REASONING IN THIS & OTHER NUMERICAL PROBLEMS.

OPT C HAS NUMEROUS POSSIBILITIES OF WORKING PROBLEMS ON SOCIETAL SCALE (GJ, TW...) AND YOU SHOULD NOT EXPECT TO SOLVE THEM CORRECTLY UNLESS YOU DO DIMENSIONAL ANALYSES AS A HABIT.

GIGAJOULE

TERAWATTS

2. Enthalpy calculations

How would you do each of the following?

- (a) Find the ΔH_c° of a "mainstream" compound (e.g., ethanol).

LOOK IT UP IN THE DATA BOOKLET.
e.g., $\Delta H_c^\circ_{\text{EtOH}} = 1367 \frac{\text{kJ}}{\text{mol}}$

- (b) Find the q from combustion of a certain number of moles of a compound (e.g., 5.0 mol of ethanol)

$q = \Delta H^\circ \cdot n$
e.g., $q = 1367 \frac{\text{kJ}}{\text{mol}} \times 5.0 \text{ mol}$
 $= 6835 \text{ kJ}$

- (c) Find the ΔH_c° of a compound that is not in the Data Booklet (e.g., naphthalene).

LOOK IT UP ON GOOGLE, OR CRC HANDBOOK OF CHEM & PHYS.

3 Variant A: Group

The year is 2000. You have been appointed as the Transport Secretaries of Hong Kong.

Your first task is to decide upon a suitable subsidy to help taxi owners convert their existing gasoline-consuming fleets to LPG-consuming ones.

It is believed that this change will be both **green** (environmentally friendly) and **economically viable** (LPG is cheaper as a fuel). However, changing out the engine is quite expensive and taxi owners request aid from the government to help them do so.

Some data your minions have collected for you:

Cost of gasoline HK\$ 1.8 / dm³

Cost of LPG HK\$ 0.6 / dm³

Fuel consumption of gasoline 13 dm³ / 100 km

Fuel consumption of LPG Unknown

Cost of engine replacement HK\$ 16000

Taxis Usually rented out and driven for two shifts of 10–12 h each.

Because your minions did not study chemistry, they are unable to help you locate other needed information. Use the internet to help you.

(If your group is absolutely stuck, use questions from Variant B to help you move forward.)

4 Variant B: Solo

Read the context in Variant A if you have not already done so.

3. (a) Identify the components in gasoline and LPG respectively.

GASOLINE/PETROL : A MIXTURE OF HYDROCARBONS,
US, CANADA UK USUALLY AROUND C8

LIQUIFIED PETROLEUM GAS : A MIXTURE OF PROPANE C_3H_8 &
 BUTANE C_4H_{10}

- (b) For gasoline, assume it is pure octane.

- i. Calculate the mass of 1.00 dm^3 gasoline.

i. 702.5 g

$$\begin{aligned} m &= V \cdot \rho \\ &= 1.00 \text{ dm}^3 \times 0.7025 \text{ kg/dm}^3 \\ &= 0.7025 \text{ kg} \\ &= 702.5 \text{ g} \end{aligned}$$

- ii. Calculate the number of moles of octane present in 1.00 dm^3 gasoline.

ii. 6.150 mol

$$\begin{aligned} n &= \frac{m}{M} = \frac{702.5 \text{ g}}{114.23 \text{ g/mol}} \\ &= 6.150 \text{ mol} \end{aligned}$$

YOU MAY HAVE USED DIFFERENT NUMBERS OR ASSUMPTIONS, AND GET TO ANSWERS THAT ARE SLIGHTLY DIFFERENT.

TO CHECK YOUR ANSWERS YOU CAN USE THE SPREADSHEET FOUND IN YOUR GOOGLE DRIVE. SEARCH FOR "5/C TAXI PROBLEM".

iii. Calculate the amount of energy when 1.00 dm³ of gasoline is completely combusted.

iii. -3.401×10^4 kJ

$$\Delta H_{\text{c, OCTANE}}^{\ominus} = -5530 \frac{\text{kJ}}{\text{mol}}$$

$$q = n \cdot \Delta H_{\text{c}}^{\ominus}$$

$$= 6.150 \text{ mol} \times -5530 \frac{\text{kJ}}{\text{mol}} = -3.401 \times 10^4 \text{ kJ}$$

iv. Calculate the fuel consumption of gasoline, giving your answer in mol/km.

iv. $0.7995 \frac{\text{mol}}{\text{km}}$

$$\text{FUEL CONSUMPTION} = \frac{13 \text{ dm}^3}{100 \text{ km}} = 0.13 \frac{\text{dm}^3}{\text{km}}$$

$$\text{FUEL CONSUMPTION in mol} = n_{\text{in } 1.0 \text{ dm}^3} \times 0.13 \frac{\text{dm}^3}{\text{km}}$$

$$= 6.150 \frac{\text{mol}}{\text{dm}^3} \times 0.13 \frac{\text{dm}^3}{\text{km}} = 0.7995 \frac{\text{mol}}{\text{km}}$$

v. Calculate the fuel cost of gasoline, giving your answer in HK\$/km.

v. $0.234 \frac{\text{HK\$}}{\text{km}}$

$$\text{FUEL COST} = 1.8 \frac{\text{HK\$}}{\text{dm}^3}$$

$$\text{FUEL CONSUMPTION} = 0.13 \frac{\text{dm}^3}{\text{km}}$$

$$\text{FUEL COST PER km} = 1.8 \frac{\text{HK\$}}{\text{dm}^3} \times 0.13 \frac{\text{dm}^3}{\text{km}} = 0.234 \frac{\text{HK\$}}{\text{km}}$$

- (c) Assuming that a car would take the same amount of energy to run, regardless of the fuel, calculate the fuel cost of LPG. Assume LPG is all propane.

(c) $\underline{0.090 \frac{\text{HK\$}}{\text{km}}}$

ENERGY REQ'D TO DRIVE 1 km = $n_{\text{OCTANE FOR 1 km}} \times \Delta H_{\text{c, OCTANE}}$
FROM (iv)
 $= 0.7995 \frac{\text{mol}}{\text{km}} \times -5530 \frac{\text{kJ}}{\text{mol}}$
 $= -4421 \frac{\text{kJ}}{\text{km}}$

THE PROBLEM NOW SIMPLIFIES TO, "HOW MUCH DOES IT COST TO BUY LPG CONTAINING - 4421 kJ OF ENERGY?" AND WE CAN RE-APPLY MOST OF THE PREV. STEPS FOR GASOLINE.

$n_{\text{PROPANE NEEDED}} = \frac{E}{\Delta H_{\text{c, prop}}} = \frac{-4421 \text{ kJ}}{-2220 \frac{\text{kJ}}{\text{mol}}} = 1.991 \text{ mol}$

$m_{\text{PROPANE}} = n \cdot M$
 $= 1.991 \text{ mol} \cdot 44.1 \frac{\text{g}}{\text{mol}} = 87.8 \text{ g}$

$V_{\text{PROPANE}} = \frac{m}{\rho} = \frac{87.8 \text{ g}}{0.5853 \frac{\text{g}}{\text{cm}^3}} = 150.0 \text{ cm}^3$
 $= 0.1500 \text{ dm}^3$

$\$_{\text{PROPANE}} = V \cdot \$_{\text{UNIT COST}}$
 $= 0.1500 \text{ dm}^3 \times 0.60 \frac{\$}{\text{dm}^3} = 0.09 \frac{\text{HK\$}}{\text{km}}$

- (d) Calculate the fuel savings after an engine switch from gasoline to LPG. Assuming that a car would take the same amount of energy to run.

(d) $0.144 \frac{\text{HK\$}}{\text{km}}$

FOR EACH km, COST IS LOWERED BY:

$$\begin{array}{r} 0.234 \\ - 0.090 \\ \hline 0.144 \end{array}$$

- (e) i. Estimate the distance a taxi travel in a day.

i. 800 km

ASSUME $2 \times 10 \text{ hr}$ SHIFTS = 20 hr .
 ESTIMATE AN AVG SPEED OF $40 \frac{\text{km}}{\text{hr}}$,
 TOTAL DISTANCE = $40 \frac{\text{km}}{\text{hr}} \times 20 \text{ hr} = 800 \text{ km}$

- ii. Calculate the fuel saving each day.

ii. $\$115.2$

DAILY SAVING = DISTANCE \times SAVINGS PER km
 $= 800 \text{ km} \times 0.144 \frac{\text{HK\$}}{\text{km}} = \$115.2$

- iii. Propose a reasonable subsidy for the engine change, outlining your reason.

iii. $\$0$

COST OF ENGINE CHANGE = $\$16000$
 DAILY SAVING = $115.2 \text{ \$/day}$
 DAYS TO RECOUP COST = $\frac{16000 \text{ \$}}{115.2 \text{ \$/day}} \approx 140 \text{ days}$.
 THE SWITCH IS ECONOMICALLY SOUND ON ITS OWN
 AFTER 4 MONTHS. SHORT ENOUGH TO WARRANT
 NO SUBSIDY.

5 Energy Density and Specific Energy

4. Energy density

Energy density describes the energy contained in a fixed volume. A higher energy density source is more compact and more convenient to carry.

Energy density is calculated as $\frac{E}{V}$, where E is the amount of energy released and V is the volume occupied by the fuel. It is often given as the SI unit $\frac{\text{kJ}}{\text{m}^3}$

5. (a) State the amount of energy released by combusting 1.00 dm³ of gasoline (octane).

(a) $3.401 \times 10^4 \frac{\text{kJ}}{\text{dm}^3}$

- (b) Convert the value into the SI unit of $\frac{\text{kJ}}{\text{m}^3}$

(b) $3.401 \times 10^7 \frac{\text{kJ}}{\text{m}^3}$

$$1 \text{ m}^3 = 1 \text{ m} \times 1 \text{ m} \times 1 \text{ m}$$

$$= 10 \text{ dm} \times 10 \text{ dm} \times 10 \text{ dm} = 1000 \text{ dm}^3$$

$$3.401 \times 10^4 \frac{\text{kJ}}{\text{dm}^3} \times \frac{1000 \text{ dm}^3}{1 \text{ m}^3} = 3.401 \times 10^{4+3} \frac{\text{kJ}}{\text{m}^3}$$

6. Explain, showing your calculations, whether gasoline or LPG has a higher energy density.

6. GASOLINE.

$$m_{1 \text{ dm}^3 \text{ LPG}} = V \times \rho = 1.00 \text{ dm}^3 \times 0.5853 \text{ kg/dm}^3 = 585.3 \text{ g}$$

$$n_{1 \text{ dm}^3 \text{ LPG}} = \frac{m}{M_{\text{propane}}} = \frac{585.3 \text{ g}}{44.1 \text{ g/mol}} = 13.2 \text{ mol}$$

$$Q_{1 \text{ dm}^3 \text{ LPG}} = n \cdot \Delta H_c_{\text{C}_3\text{H}_8} = -29363 \text{ kJ}$$

7. Specific energy

Specific energy describes the energy released from a fixed mass. A source with higher specific energy is lighter.

Specific energy is calculated as $\frac{E}{m}$, where E is the amount of energy released and m is the volume occupied by the fuel. It is often given as the SI unit $\frac{\text{kJ}}{\text{kg}}$

(a) State the amount of energy released by combusting 1.00 dm³ of gasoline (octane).

(a) $-3.401 \times 10^4 \frac{\text{kJ}}{\text{dm}^3}$

(b) Calculate the specific density of gasoline.

(b) $-48410 \frac{\text{kJ}}{\text{kg}}$

$$m_{1 \text{ dm}^3 \text{ gasoline}} = V \cdot \rho = 0.7025 \text{ kg}$$

$$\text{SPECIFIC DENSITY} = \frac{E}{m} = \frac{-34010 \text{ kJ}}{0.7025 \text{ kg}} = -48412 \frac{\text{kJ}}{\text{kg}}$$

(c) Explain, showing your calculations, whether gasoline or LPG has a higher specific energy.

(c) LPG

$$\frac{\text{SPEC.}}{E_{\text{LPG}}} = \frac{E}{m} = \frac{-29363 \text{ kJ}}{0.585 \text{ kg}} = -50193 \frac{\text{kJ}}{\text{kg}}$$

NOTICE THAT DUE TO SUBSTANCES HAVING DIFFERENT DENSITIES, THEY COULD RANK FAVORABLY WRT ENERGY DENSITY BUT UNFAVORABLY WRT SPECIFIC ENERGY.
